

Final Project – Topic Brainstorm and Share Activity

Name:

As we start final projects, the first task for each of you is to identify a new statistical topic of interest that you'd like to explore. The final project requires everyone to learn about a statistical topic new to them. What is "new" will differ based on what electives you've taken, computer science courses you've taken, summer experiences you've had, etc. In past semesters, I've found the biggest hurdle is students don't know much about what topics they might be able to explore, so we're taking a different approach this semester.

First, I need to solicit some info from each of you (below). This will be used to help make a giant list of potential topics (to be shared Wednesday), which will be randomly assigned to folks (two each) to tell us more about in class on Monday, Nov. 3, in an informal shared joint slide presentation. This should give you many topics to consider and broaden your exposure to potential topics. There are demo Google slides for the presentation, etc. and we'll just do it going around in class. This sheet is in the class repo for reference.

What courses have you taken that are either filling elective slots for the statistics major or are related fields courses where you've seen new statistical methods?

Next, are there already some topics or topic areas that you would like to explore more?
What topics or topic areas? (I.E. do you already have project ideas?)

Finally, what application areas do you envision applying statistics in, either in the future or for the final project? I.E. economics, sports, etc.
